

ABSTRACT OF THE DISCLOSURE

A cyclone vacuum cleaner having an operation handle that can be directly connected with assorted accessory brushes, includes a main body, an operation handle disposed on an air suction path extending from the main body to provide a means of user manipulation, a cyclone dust collector disposed between the operation handle and the main body to collect dust, and a brush connected to the operation handle to draw in air from an area to be cleaned, including entrained dust, and a flexible hose connecting the operation handle to the main body. The cyclone dust collector may be disposed at various positions between the operation handle and the main body, including between an end of the flexible hose and the operation handle, in an intermediate position between two sections of the flexible hose or between a distal end of the flexible hose, removed from the operation handle, and the main body.
